Homer, Alaska

YUKON LAND USE PLANNING COUNCIL

Outline

- Context:
 - Regional Planning in the Yukon
 - The North Yukon Regional Land Use Plan
- Disturbance Tracking
 - Why
 - How
 - Examples and Issues

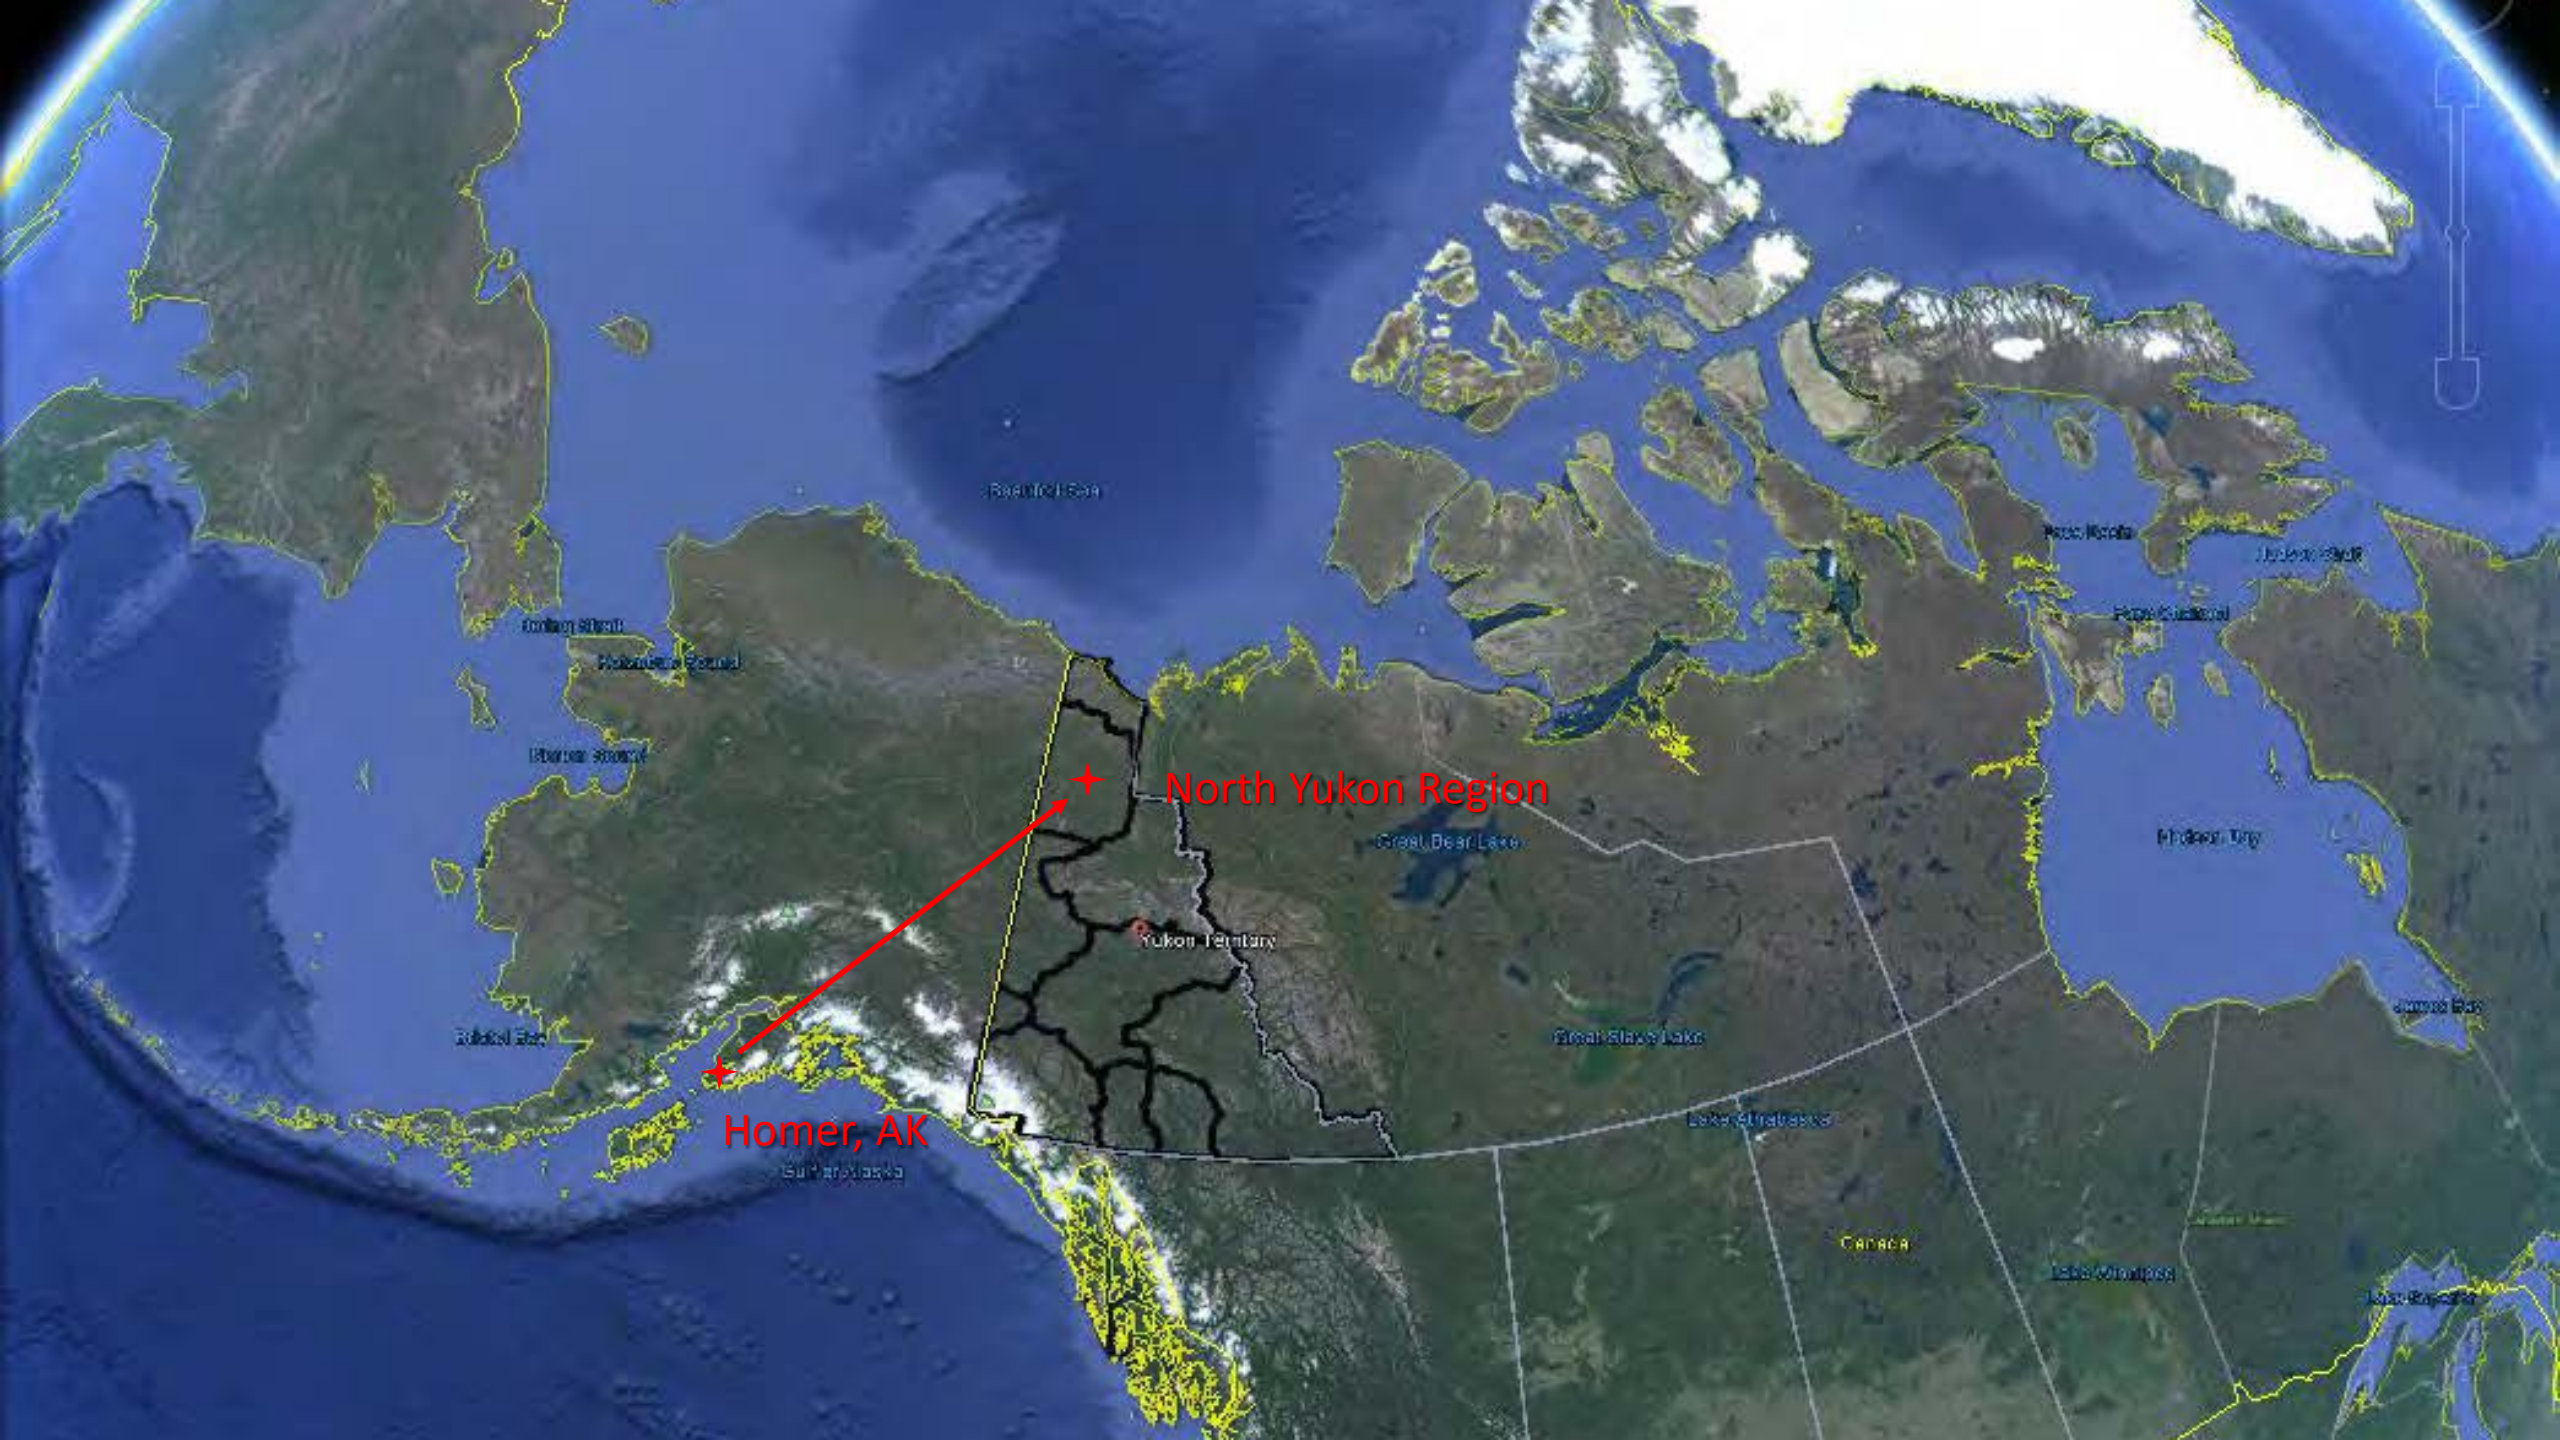

X Conclusions

Regional Planning in the Yukon

- Land Claims with Yukon First Nations (~Tribes) set up a general regional planning framework
- Neutral advisory Council
- Council makes recommendation to the FNs and Yukon Govt., assist Commissions
- Commissions +/- independently develop regional plans

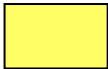

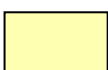

Planning Region

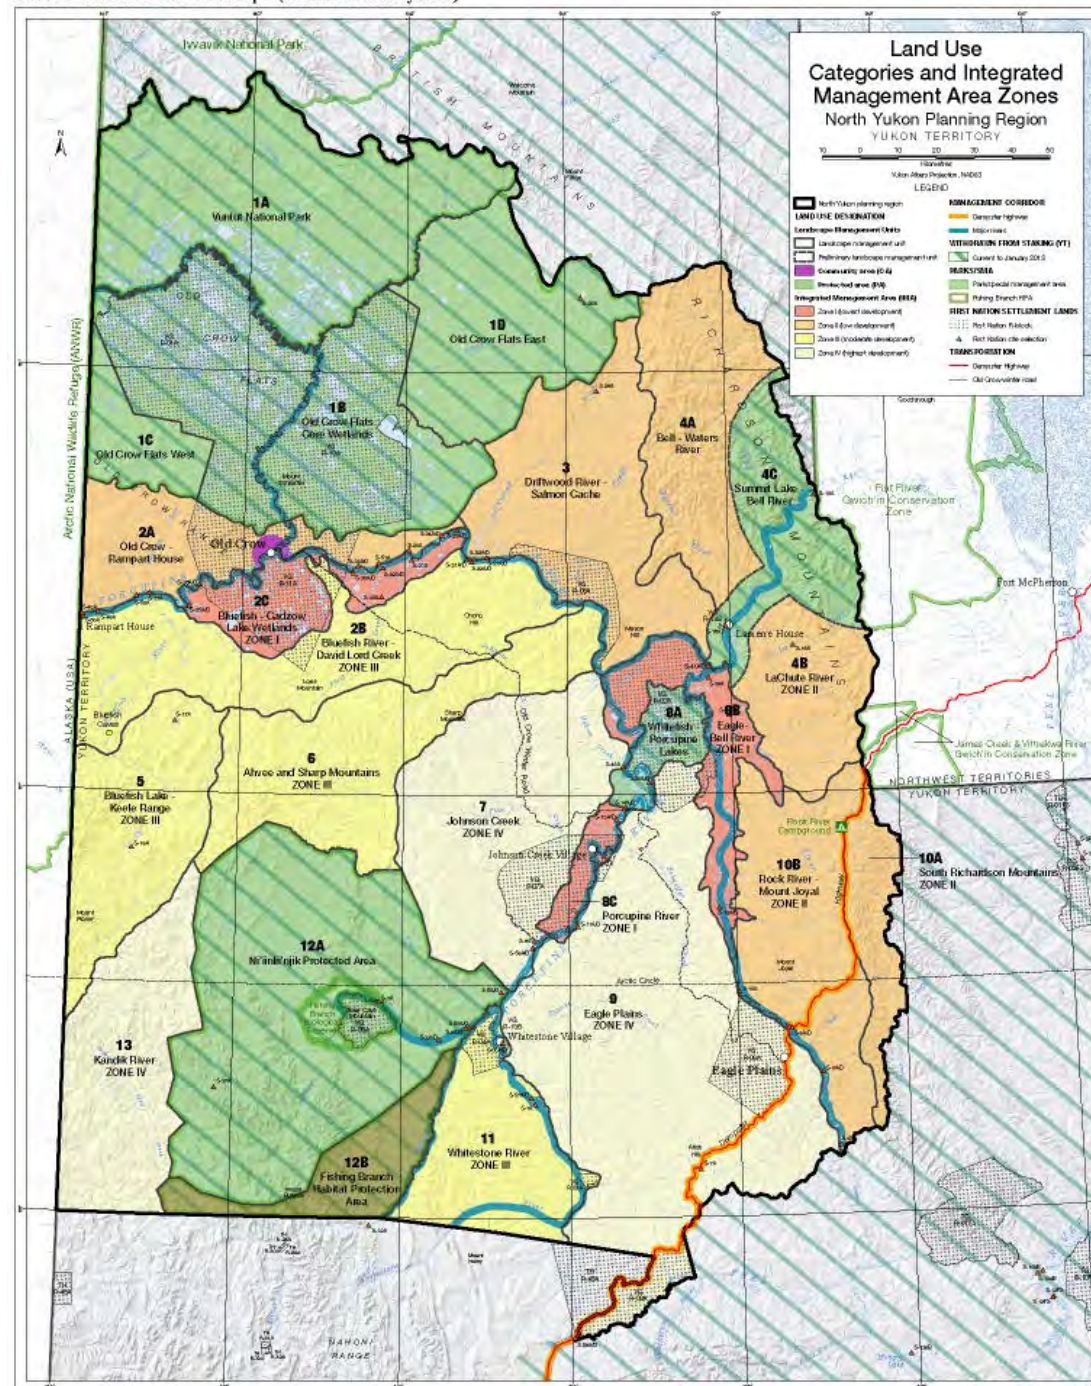

Key Features

- Traditional Territory of the Vuntut Gwitchin
- Community of Old Crow (300 people)
- 56,000 km²
- Beringian
- Continuous permafrost zone
- Oil & Gas basin
- Caribou winter range

North Yukon Land Use Plan

Protected		No acceptable change
Integrate Management Areas		
Zone I		 <p>Lower</p> <p>Higher</p> <p>acceptable change</p>
Zone II		
Zone III		
Zone IV		

Levels of Acceptable Change

- Cut trees or disturbed hydrology/soil
- *Surface disturbances* (polygonal), and
- *Linear disturbances* (lines) (>1.5m wide)

But what kind of changes are we talking about?

YUKON LAND USE
PLANNING COUNCIL

New seismic (2013)

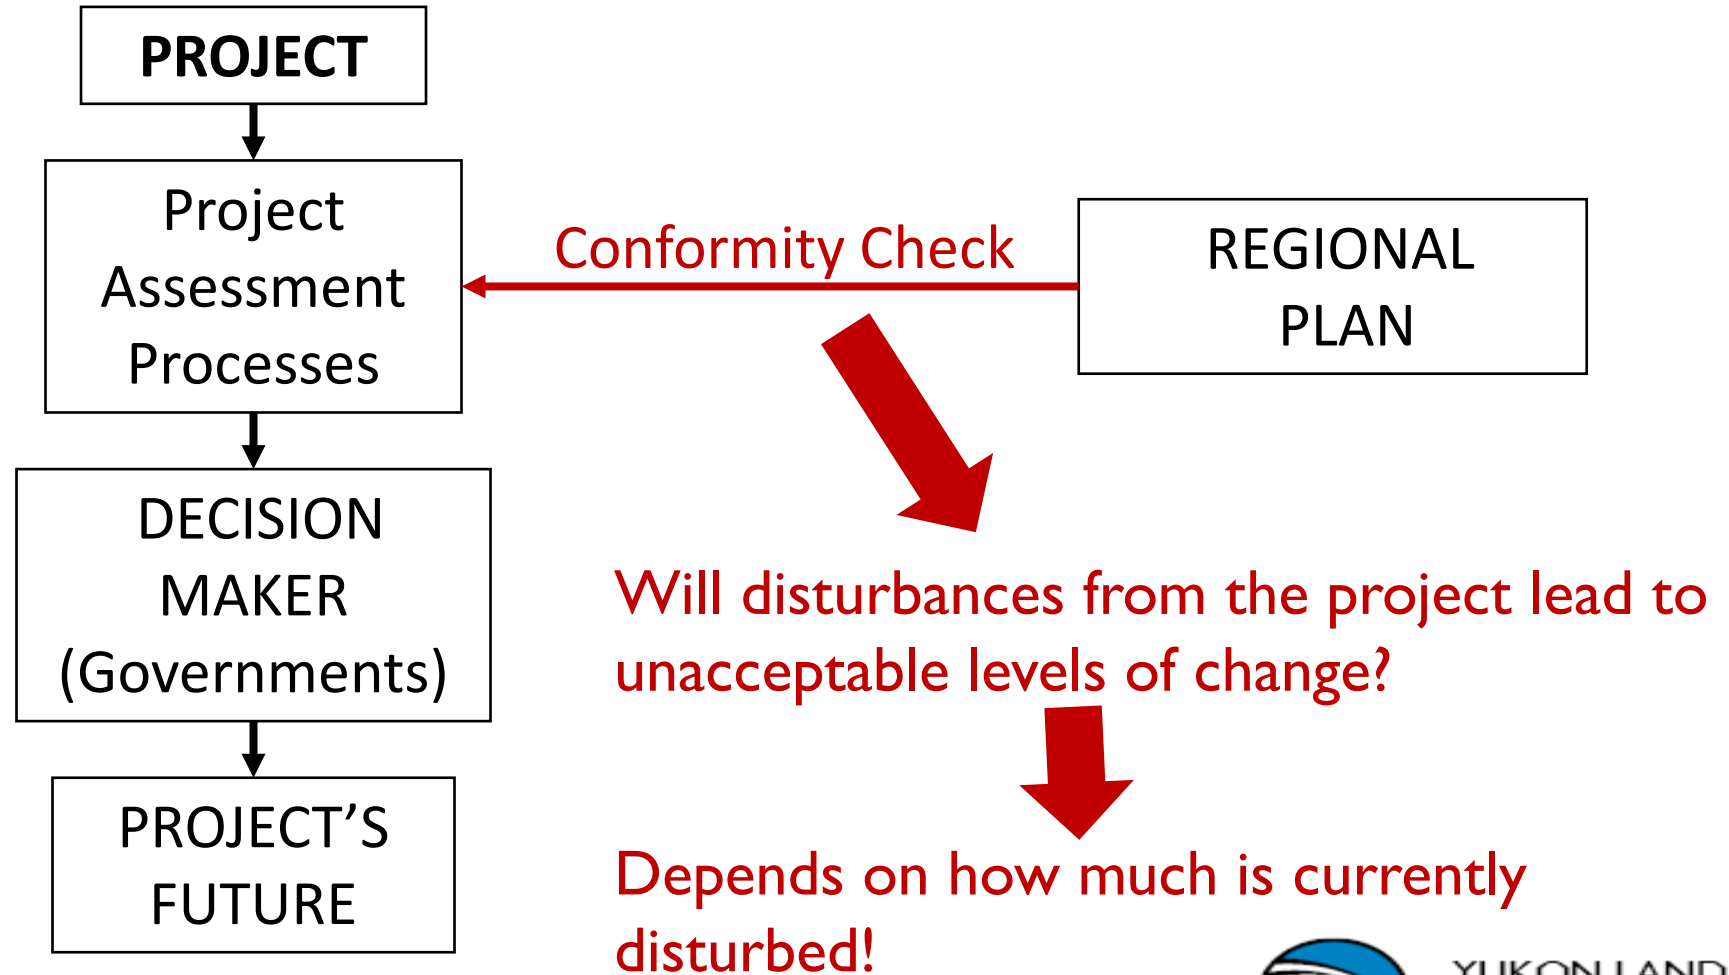

Old seismic (circa 1970)

Dempster Highway

YUKON LAND USE
PLANNING COUNCIL

End Use: Project Specific Review

Commission's estimate of cumulative disturbance =

Cut-lines and trails from national topographic database +

Oil & Gas exploration data –

Double-counted features –

20%

Lots has recovered, but lots was not mapped or archived

YUKON LAND USE
PLANNING COUNCIL

Tracking cumulative disturbance totals ...

Current cumulative disturbance =

Baseline disturbance +

Initial inventory

Recent disturbance –

Reports from developer

Recovered disturbances

Recovery models

- When soil/hydrology disruptions no longer apparent, or
- When trees or shrubs >1.5m are present

OR...

Current cumulative disturbance =

Updated baseline disturbance ← Frequent inventories

+

New disturbance

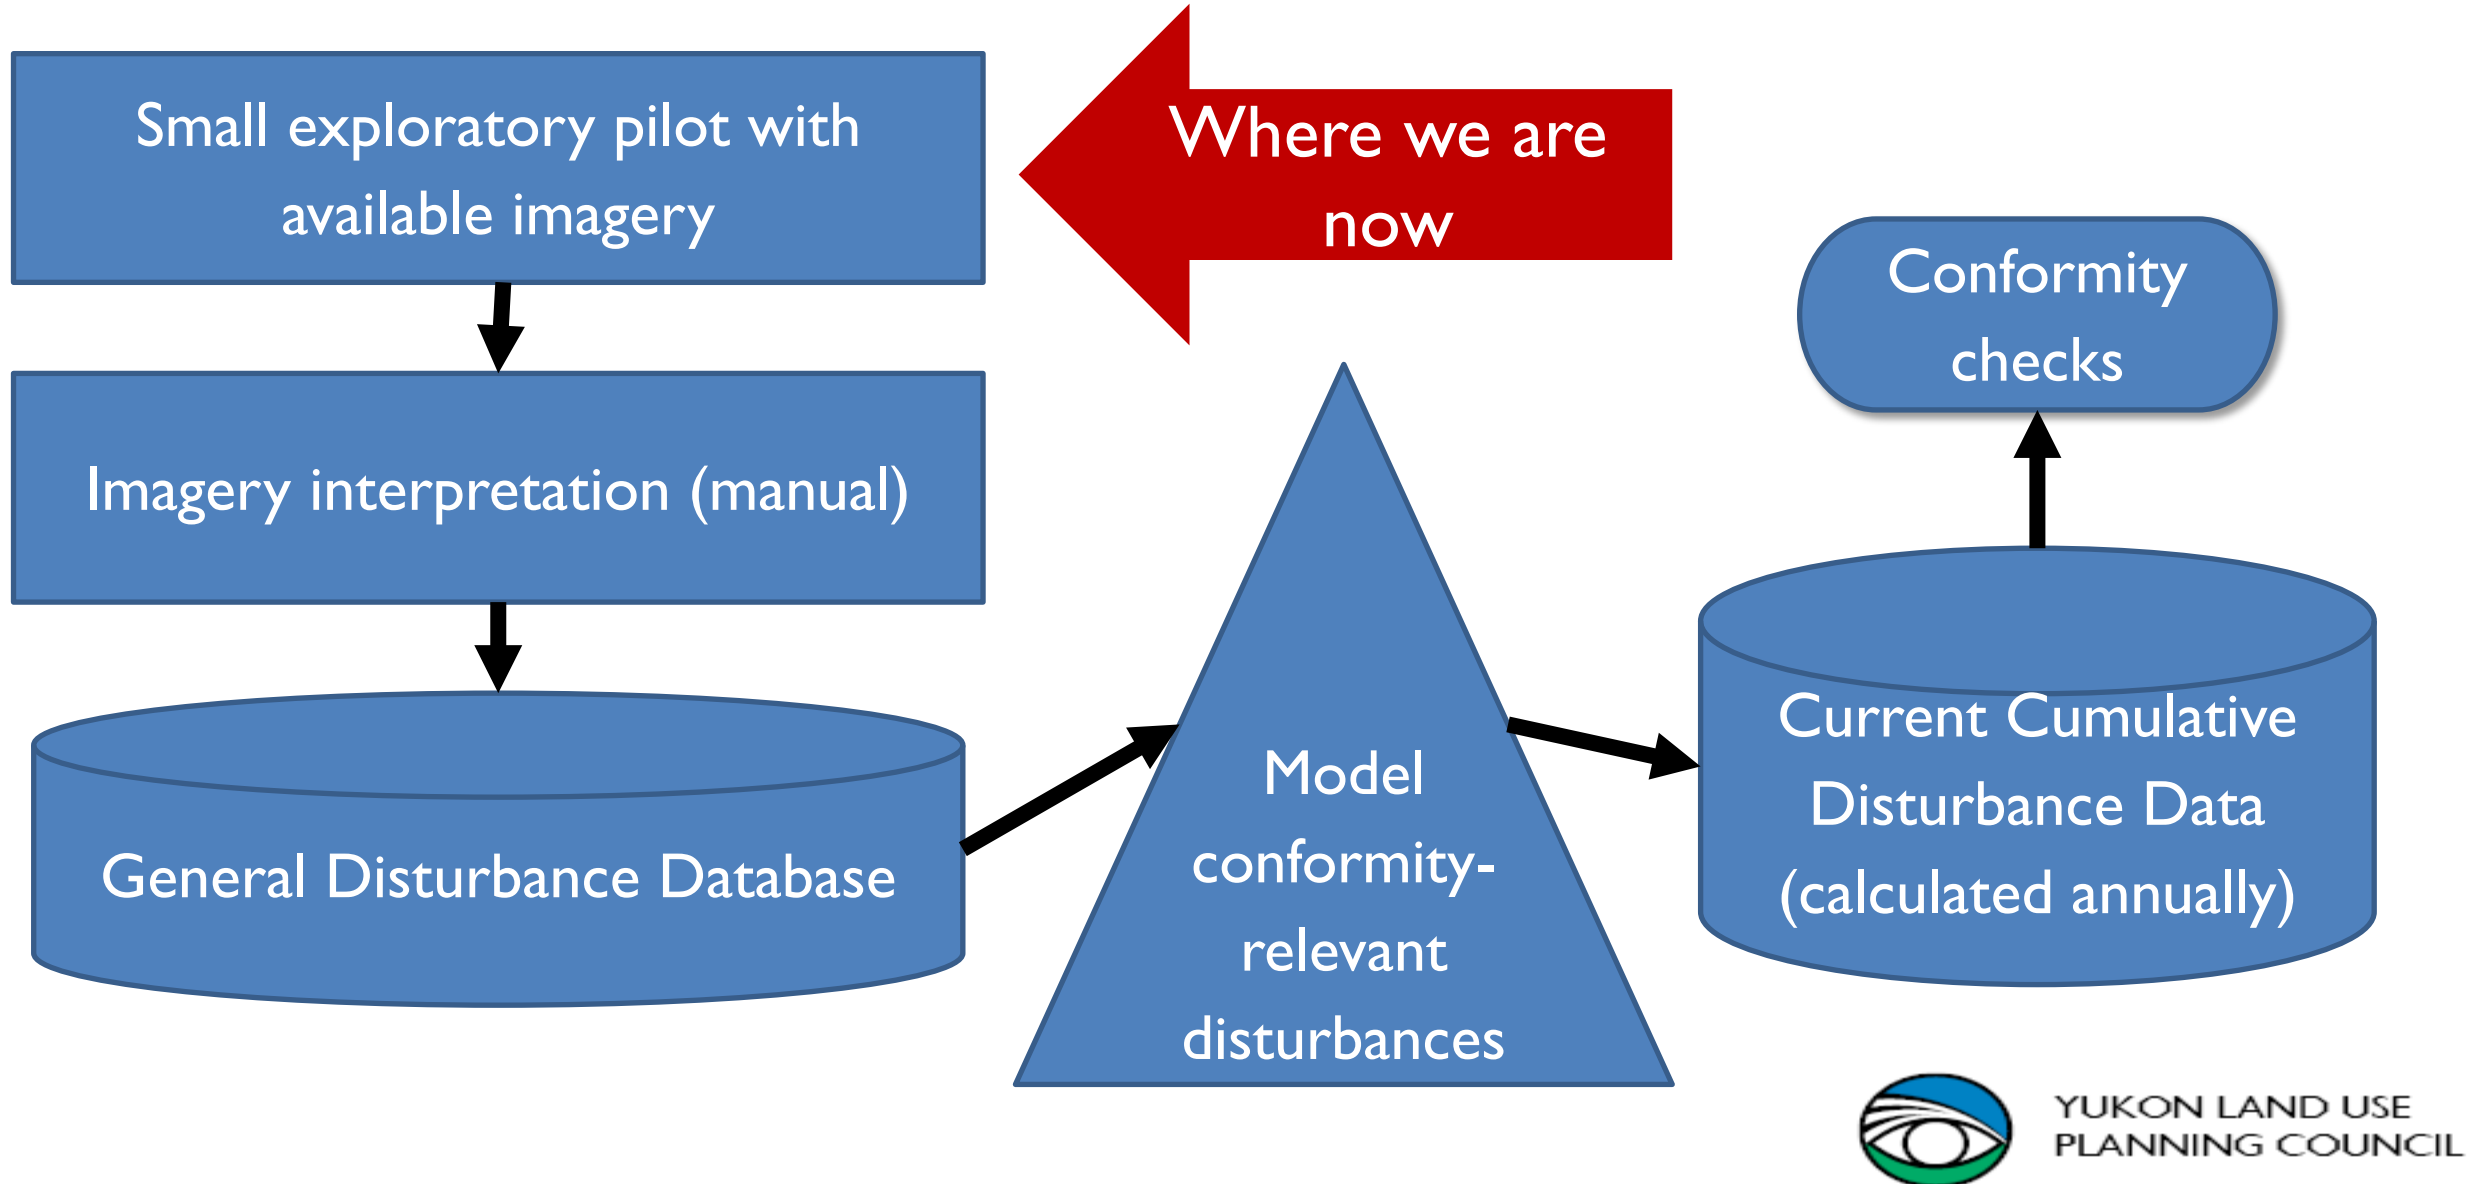

← Reports from developer

~~Recovery models~~

PLANNING COUNCIL

General Approach

North Yukon Land Use Plan: Map 1 (Amended January 2012)

- [illegible]

Field Observations

Goals:

- Define ecological status and succession of legacy disturbances
- Understand recovery dynamics and variation

Paired plots:

- Soil characteristics
- Active layer depth
- Plant communities
- Tree mensuration
- Visibility
- ...

Energy Mines and Resources.
Linear Disturbance Study Team.

What do we need to discern?

Disturbances:

- Trees cut and no woody regen > 1.5m
- Soil/hydrology changes
- Linear features > 1.5m wide

Attributes from other data that may help

- Surrounding veg community
- Landscape position

Interpreted attributes that may help

- Veg community of disturbance (esp. herbs vs shrubs)
- Surrounding veg community
- Width of disturbance (linear)
- Type and approx. age of disturbance
- Re-use? How & when?

What have we found?

YUKON LAND USE
PLANNING COUNCIL

LiDAR?

- LiDAR should be able to get height of regen (DSM – DEM), BUT \$\$\$
- Less useful for soil/hydrological disturbances
- Just received sample – no work yet

Multispectral Indices?

- NDVI etc may be able to help differentiate different plant communities
- 4th band (NIR) being worked up (SPOT6 & Pleiades)

SPOT6 (432 bands)

YUKON LAND USE
PLANNING COUNCIL

Pleiades

SPOT6 (432)

LiDAR

YUKON LAND USE
PLANNING COUNCIL

Automated Classification

- Polygonal: yes, lines: no (?)
- Anthropogenic vs natural

“Road” with successional stagnation

SPOT6

Next Steps

- Get NIR 4th bands
- Explore NDVI etc and LiDAR
- Finalize process
- Purchase imagery to fill gaps
- Interpret disturbances
- Derive and publish disturbance metrics

Thank You!

Questions?
